

(a) $N = 32$, $P = 30$; 400 paired trials/point

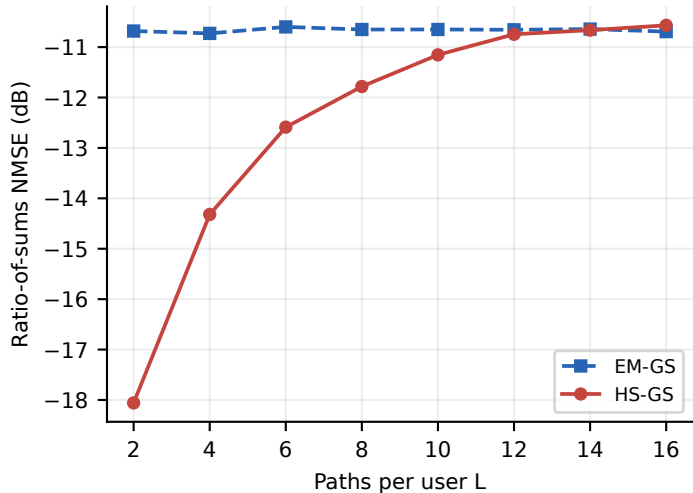

(b) Array-size comparison, RSR = 12 dB

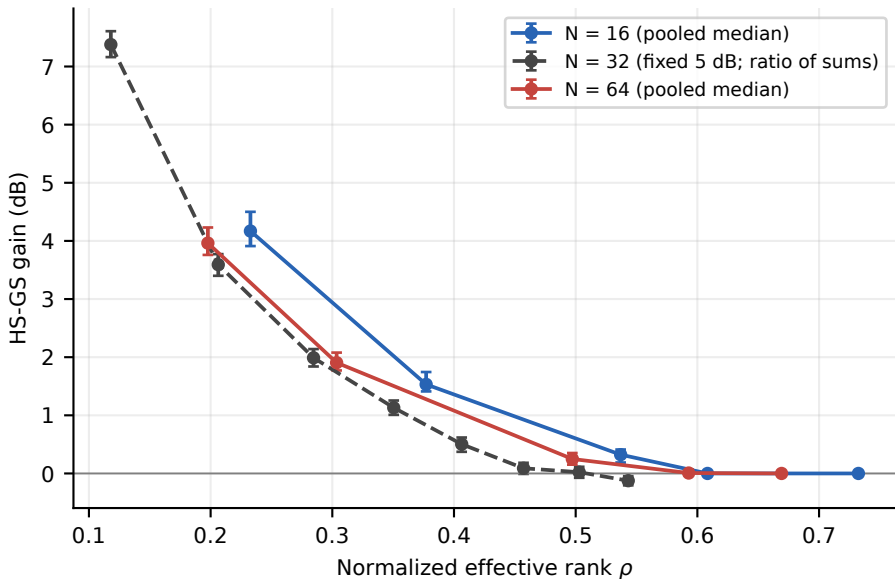

(a) $N = 32$, SNR = 5 dB; 300 trials/point

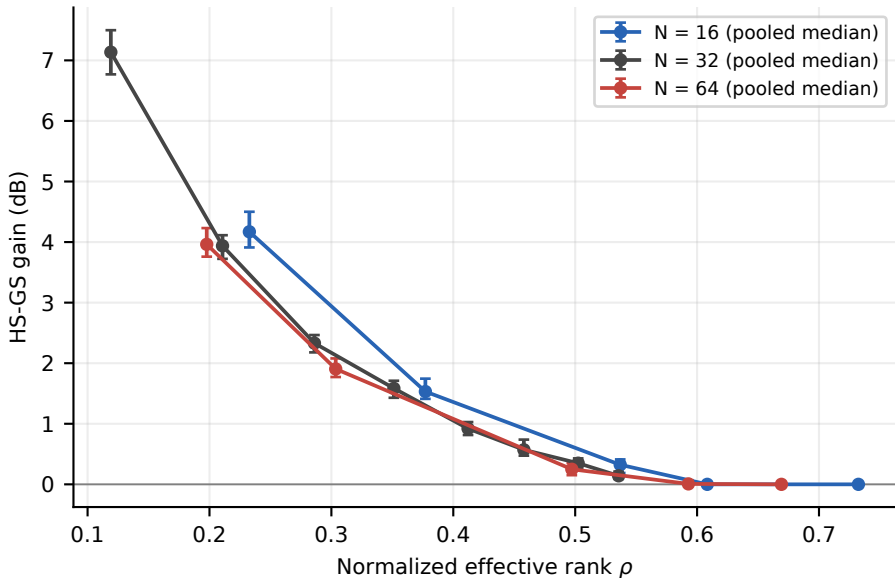

(b) Absolute error, $P = 30$, RSR = 12 dB

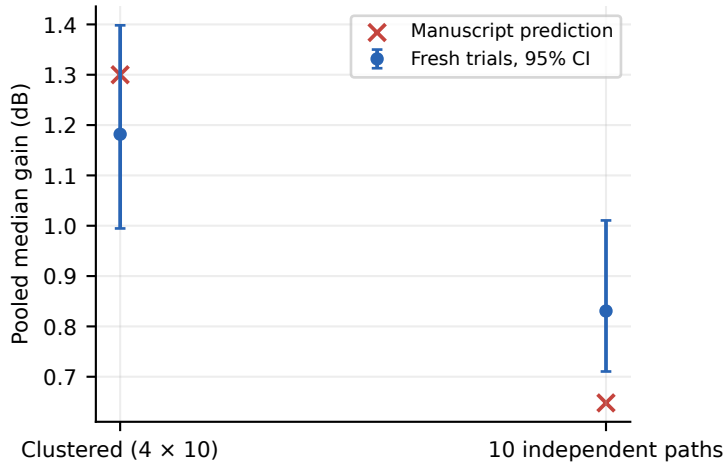

Original Figure 3 design: configurations differ

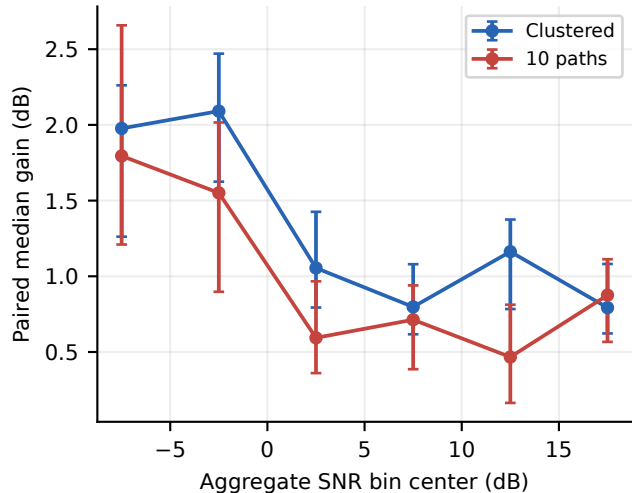

Matched configuration: $P = 20$, RSR = 10 dB

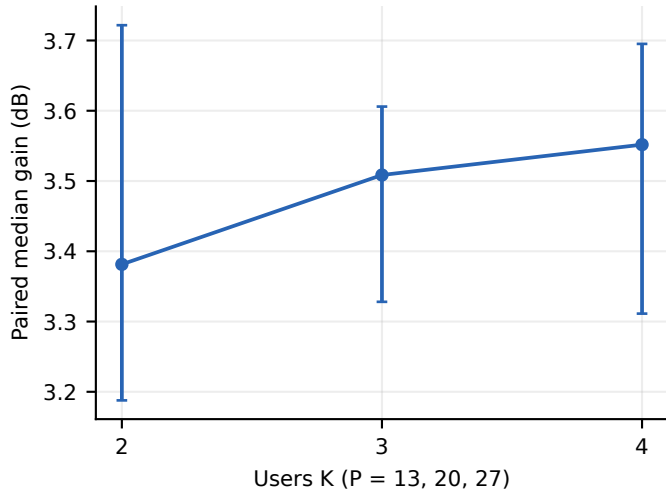

(a) 400 new trials per distribution

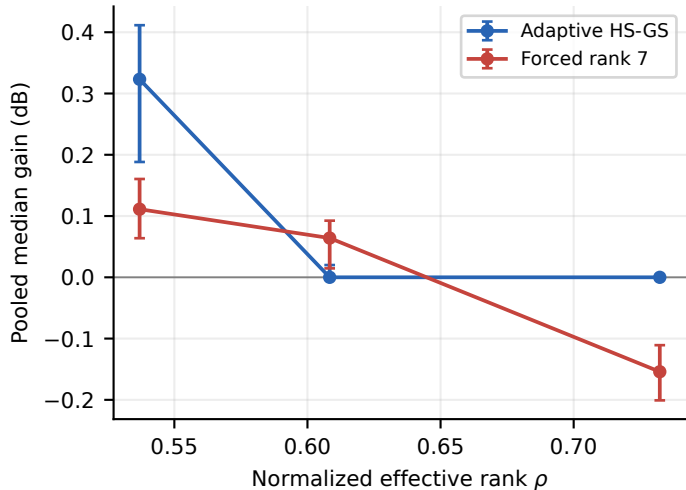

(b) Dependence on SNR

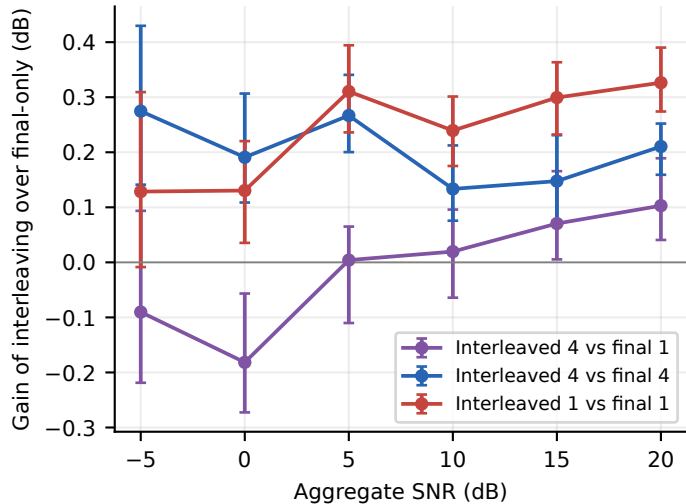

(a) SNR ≥ 5 dB; fixed $L = 5$

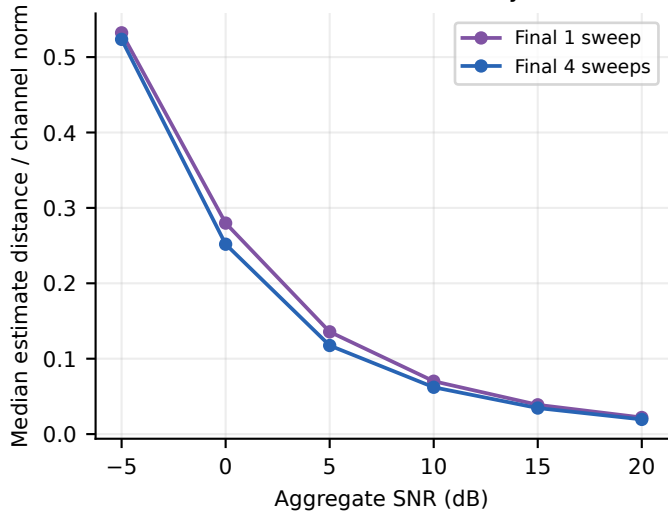

(b) $N = 16$; forced constraint diagnostic

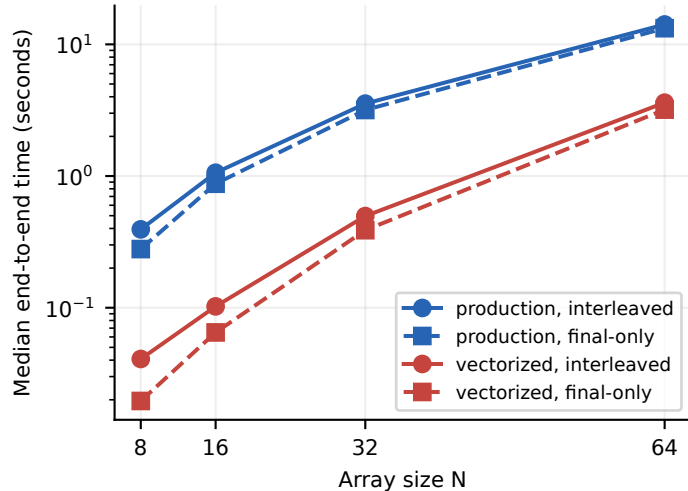

(a) Paired medians; shared selected rank

(b) Interleaved-4 versus final-only estimates

(a) Rank selection included; final-only uses 4 sweeps

(b) Interleaved estimator; three trials per point
